//status: not tested
//**for directed graphs only** if you initialize len[i][i] to infinity, then
//afterward floyds, len[i][i] = length of shortest cycle including node 'i'
//another trick: change 'len' to 2d array of *bools* where len[i][j] = true if
//there exists an edge from i \rightarrow j in initial graph. Also do:
//'len[i][j] |= len[i][k] & len[k][j]'
//Then after floyds, len[i][i] = true iff there's exists some path from node
//'i' to node 'j'
//Changing the order of for-loops to i-j-k (instead of the current k-i-j)
//results in min-plus matrix multiplication. If adjacency matrix is M, then
//after computing M^k (with binary exponentiation), M[i][j] = min length path
//from i to j with at most k edges.
